Business Question : What trends in smart - device usage can guide Bellabeat's marketing?
Limitation : The sample is small and data is old, with no demographic information so finding may not generalized.
Data Source: The Fitbit Dataset (Mobius, Kaggle), about 35 users of one month 2016.

Key Findings

1.Out of 35 users only 7 users had used fitness trackers 15 days or more than 15 days in a month.
2.From my analysis Wednesday(7.4k) and Saturday(7.1k) comes out to be most active days whereas Tuesday(4.9k) is the least active day.
3.From my analysis, sleep and bed time are strongly correlated(r=0.93) , average sleep is 7H 22min a day. Users spend about 38 minutes awake in bed each day.
4.Steps and calories burned are positively related. Each additional 1,000 steps is associated with about 88 more calories burned there are other factor also such as age, weight and workout type.
5.Very Active minutes have strongest link to steps while sedentary minutes are negatively

Recommendations for Bellabeat

1.Tuesday step challenge. Send an app reminder or a mini challenge on Tuesdays, the least active day, to lift the weekly average.

2.Calorie-linked goals. Show step goals as calories burned (for example, "+1,000 steps ≈ +88 kcal") to motivate users in the Bellabeat app.

3.Boost tracker usage. Since only 20% of users log more than 15 days, add streak badges or weekly summary notifications to keep users engaged.

4.Add a bedtime reminders to reduce the 38 minutes users spend awake in bed.
